PROBLEM OF ERADICATION OF INFECTIONS AND QUESTIONS OF PLANNING OF ANTIEPIDEMIC  
MEASURES /Eradication of Hog Cholera/

K. P. Andreyev

/Extract translation/

Eradication of the virus of hog cholera is completely feasible. A successful solution of this problem during the next 2-3 yrs is facilitated by the fact that the majority of oblast's and republics has been free from this infection for 5-10 yrs or longer. Consequently, what remains to be done in order to eradicate this disease completely and destroy its causative factor is to concentrate the effort on only a few oblast's.

Further perfection of the crystal-violet vaccine, extensive application of the vaccination method and serum prophylaxis in unsafe and threatened zones, and rigid sanitary measures as well as effective disinfection will contribute to a successful completion of this task.

END.
